

Seed Treating **Solutions**

LP800 TREATER

2011

Operators Manual & Training DVD

INTRODUCTION

Thank you for choosing USC, LLC for your equipment needs. We appreciate your business and will work diligently to ensure that you are satisfied with your choice.

OVERVIEW

The purpose of this manual is to provide you with the basic information needed to operate and maintain the LP800. It does not hold USC, LLC liable for any accidents or injuries that may occur.

OPERATOR RESPONSIBILITIES

As the purchaser/owner/operator of this equipment and control system, you have an obligation to install, operate, and maintain the equipment in a manner that minimizes the exposure of people in your care to any potential hazards inherent in using this equipment. It is critical that the owner of this equipment:

- Has a clear and documented understanding of the process this machine is being used in and of any resulting hazards or special requirements arising from this specific application.
- Allow only properly trained and instructed personnel to install, operate, or service this equipment.
- Maintain a comprehensive safety program involving all who work with this machine and other associated process equipment.
- Establish clear areas of staff responsibility (e.g. operation, setup, sanitation, maintenance, and repairs).
- Provide all personnel with necessary safety equipment.
- Periodically inspect the equipment to insure that the doors, covers, guards, and safety devices are in place and functioning, that all safety instructions and warning labels are intact and legible, and that the equipment is in good working order.
- In addition to the operating instructions, observe and enforce the applicable legal and other binding regulations, national and local codes.

As the person with the most to gain or lose from working safely, it is important that you work responsibly and stay alert. By following a few simple rules, you can prevent an accident that could injure or kill you or a co-worker.

- Do not operate, clean, or service this equipment until you have read and understood the contents of this manual. If you do not understand the information in this manual, bring it to the attention of your supervisor, or call your local USC dealer for assistance.
- Any operator who is known or suspected to be under the influence of alcohol or drugs should not be allowed to operate the equipment.
- Understand and follow the safety practices required by your employer and this manual.
- **PAY ATTENTION** to what you and other personnel are doing and how these activities may affect your safety.
- **Failure to follow these instructions may result in serious personal injury or death.**

RECEIVING YOUR EQUIPMENT

As soon as the equipment is received, it should be carefully inspected to make certain that it has sustained no damage during shipment and that all items listed on the packing list are accounted for. If there is any damage or shortages, the purchaser must immediately notify your USC dealer. Ownership passes to purchaser when the unit leaves the USC, LLC. premises. The purchaser is responsible for unloading and mounting all components of the equipment.

Document the serial number of the machine for future reference. The serial number is located on the upper right corner of the main control panel mounting bracket.

SERIAL NUMBER: _____

LEGEND

Throughout this manual there are small icons located in the left margin. They indicate special information that may apply to your seed treater model. As the legend below indicates, there is 1 icon, each of which represent a different seed treater setup. If you have a Cotton/Rice treater, please take note when one of these pictures is shown because it provides pertinent information.

LEGEND

Represents information specific to treaters designed to treat Cotton and Rice seed

SECTION
A**SAFETY INSTRUCTIONS**

Every year accidents in the work place maim, kill, and injure people. Although it may be impossible to prevent all accidents, with the right combination of training, operating practices, safety devices, and operator vigilance, the number of accidents can be significantly reduced. The purpose of this section is to educate equipment users about hazards, unsafe practices, and recommended hazard avoidance techniques.

SAFETY WORDS AND SYMBOLS

It is very important that operators and maintenance personnel understand the words and symbols that are used to communicate safety information. Safety words, their meaning and format, have been standardized for U.S. manufacturers and published by the American National Standards Institute (ANSI). The European Community (E.C.) has adopted a different format based on the International Standards Organization (I.S.O.) and applicable machinery directives. Both formats are presented below. Graphic symbols are not standardized, but most manufacturers will use some variation of the ones seen in this manual.

Indicates an imminently hazardous situation which, if not avoided, **will** result in death or serious injury.

Indicates a potentially hazardous situation which, if not avoided, **could** result in death or serious injury.

Indicates a potentially hazardous situation which, if not avoided, **may** result in minor or moderate injury and/or property damage.

Provides additional information that the operator needs to be aware of to avoid a potentially hazardous situation.

Mandatory Lockout Power Symbol. Disconnect, lockout, and tagout electrical and other energy sources before inspecting, cleaning, or performing maintenance on this panel.

International Safety Alert Symbol. The exclamation point (!) surrounded by a yellow triangle indicates that an injury hazard exists. However, it does not indicate the seriousness of potential injury. The exclamation point (!) is also used with the DANGER, WARNING, and CAUTION symbols so the potential injury is indicated.

Electrocution Hazard Symbol. This symbol indicates that an electrocution hazard exists. Serious injury or death could result from contacting high voltage.

International Electrocution Hazard. This symbol indicates that an electrocution hazard exists. Serious injury or death could result from contacting high voltage.

Mandatory Read Manual Action Symbol. (I.S.O. format)
This symbol instructs personnel to read the Operators Manual before servicing or operating the equipment.

Mandatory Read Manual Action Symbol. This symbol instructs personnel to read the Operators Manual before servicing or operating the equipment.

NOTICE

Notice is used to notify people of important installation, operation, or maintenance information which is not hazard related.

LOCKOUT / TAGOUT PROCEDURES

Lockout/Tagout is the placement of a lock/tag on an energy isolating device in accordance with an established procedure. When taking equipment out of service to perform maintenance or repair work, always follow the lockout/tagout procedures as outlined in ANSI Z344.1 and/or OSHA Standard 1910.147. This standard “requires employers to establish a program and utilize procedures for affixing appropriate lockout devices or tagout devices to energy isolating devices and to otherwise disable machines or equipment to prevent unexpected energizing, start-up, or release of stored energy in order to prevent injury to employees.”

CONTROLLED STOP

This is the stopping of machine motion by reducing the electrical command signal to 0 (zero) once the stop signal has been recognized.

HAZARD REVIEW

Electrocution Hazard

Electrocution accidents are most likely to occur during maintenance of the electrical system or when working on or near exposed high voltage wiring.

This hazard does not exist when the electrical power has been disconnected, properly locked, and tagged out.

Automatic Start Hazard

This seed treating system is usually controlled by an automated system and may start without warning. Failure to properly disconnect, lockout, and tagout all energy sources of remotely controlled equipment creates a very hazardous situation and could cause injury or even death. PLEASE STAY CLEAR AND BE ALERT.

YOU are responsible for the **SAFE** operation and maintenance of your USC, LLC Seed Treating System. **YOU** must ensure that you and anyone else who is going to operate, maintain, or work around the Seed Treating System be familiar with the operating and maintenance procedures and related **SAFETY** information contained in this manual. This manual will take you step-by-step through your working day and alert you to good safety practices that should be adhered to while operating the Seed Treating System.

Remember, **YOU** are the key to safety. Good safety practices not only protect you, but also the people around you. Make these practices a working part of your safety program. Be certain that **EVERYONE** operating this equipment is familiar with the recommended operating and maintenance procedures and follows all the safety precautions. Most accidents can be prevented. Do not risk injury or death by ignoring good safety practices.

- LP Series Seed Treater owners must give operating instructions to operators or employees before allowing them to operate the machine, and at least annually thereafter per OSHA (Occupational Safety and Health Administration) regulation 1928.57.
- The most important safety device on this equipment is a **SAFE** operator. It is the operator's responsibility to read and understand **ALL** Safety and Operating instructions in the manual and to follow them. All accidents can be avoided.
- A person who has not read and understood all operating and safety instructions is not qualified to operate the machine. An untrained operator exposes himself and bystanders to possible serious injury or death.
- Do not modify the equipment in any way. Unauthorized modification may impair the function and/or safety and could affect the life of the equipment.
- Think SAFETY! Work SAFELY!

GENERAL SAFETY

1. Read and understand the Operator's Manual and all safety signs before operating, maintaining, adjusting or unplugging the LP Series Seed Treater.
2. Only trained persons shall operate the seed treater. An untrained operator is not qualified to operate the machine.
3. Have a first-aid kit available for use should the need arise, and know how to use it.

4. Provide a fire extinguisher for use in case of an accident. Store in a highly visible place.
5. Do not allow children, spectators or bystanders within hazard area of machine.
6. Wear appropriate protective gear. This includes but is not limited to:

- A hard hat
- Protective shoes with slip resistant soles
- Protective goggles
- Heavy gloves
- Hearing protection
- Respirator or filter mask

7. Place all controls in neutral or off, stop motor, and wait for all moving parts to stop. Then disable power source before servicing, adjusting, repairing, or unplugging.

8. Review safety related items annually with all personnel who will be operating or maintaining the LP Series Seed Treater.

OPERATING SAFETY:

1. Read and understand the Operator's Manual and all safety signs before using.
2. Disconnect and disable electrical supply completely and wait for all moving parts to stop before servicing, adjusting, repairing or unplugging.
3. Clear the area of bystanders, especially children, before starting.
4. Be familiar with the machine hazard area. If anyone enters hazard area, shut down machine immediately. Clear the area before restarting.
5. Keep hands, feet, hair and clothing away from all moving and/or rotating parts.
6. Stay away from overhead obstructions and power lines during operation and transporting. Electrocution can occur without direct contact.
7. Do not operate machine when any guards are removed.
8. Inspect welds and repair if needed.

PLACEMENT SAFETY

1. Move only with the appropriate equipment
2. Stay away from overhead power lines when moving Seed Treating System. Electrocutation can occur without direct contact.
3. Be familiar with machine hazard area. If anyone enters hazard areas, shut down machine immediately. Clear the area before restarting.
4. Operate the Seed Treater on level ground free of debris. Anchor the Seed Treater to prevent tipping or upending.

Before placement of the Seed Treater, be sure that ground is reasonably level. The Seed Treater may topple or work improperly if the ground is too uneven, damaging the equipment and/or causing personal injury.

MAINTENANCE SAFETY

1. Review the Operator's Manual and all safety items before working with, maintaining or operating the Seed Treating System.
2. Place all controls in neutral or off, stop motors, disable power source, and wait for all moving parts to stop before servicing, adjusting, repairing or unplugging.
3. Follow good shop practices:
Keep service area clean and dry.
Be sure electrical outlets and tools are properly grounded.
Use adequate light for the job at hand.
4. Keep hands, feet, hair and clothing away from all moving and/or rotating parts.
5. Clear the area of bystanders, especially children, when carrying out any maintenance and repairs or making any adjustments.
6. Before resuming work, install and secure all guards when maintenance work is completed.
7. Keep safety signs clean. Replace any sign that is damaged or not clearly visible.

SAFETY SIGNS

1. Keep safety signs clean and legible at all times.
2. Replace safety signs that are missing or have become illegible.
3. Replaced parts that displayed a safety sign should also display the current sign.
4. Safety signs are available from your Authorized Dealer.

How to Install Safety Signs:

- Be sure that the installation area is clean and dry.
- Be sure temperature is above 50°F (10°C).
- Decide on the exact position before you remove the backing paper.
- Remove the smallest portion of the split backing paper.
- Align the sign over the specified area and carefully press the small portion with the exposed sticky backing in place.
- Slowly peel back the remaining paper and carefully smooth the remaining portion of the sign in place.
- Small air pockets can be pierced with a pin and smoothed out using the piece of sign backing paper.

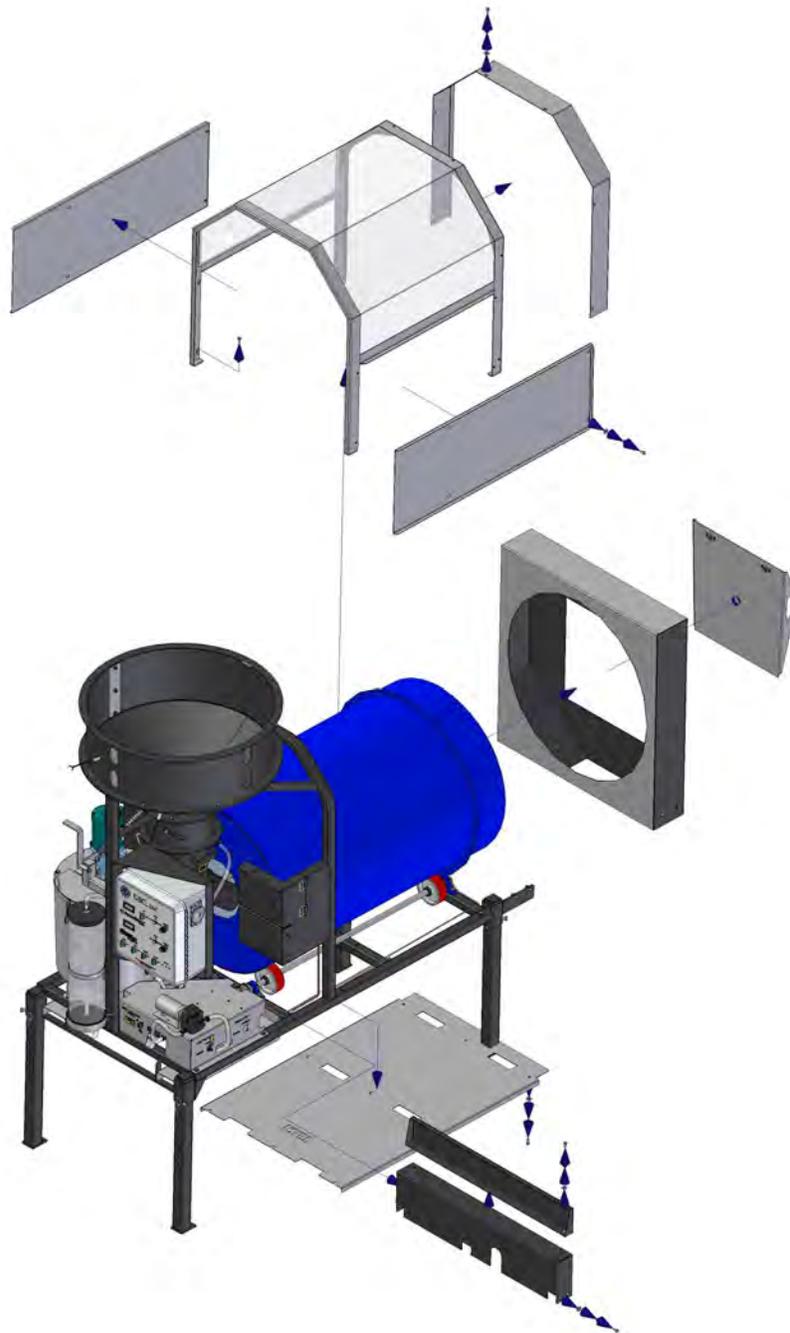

Located on the USC equipment you will find safety labels. Always be sure to read and follow all directions on the labels.

Guards provided with USC Seed treater are to remain in place during operation.

SECTION
B**INSTALLATION**

HIGH VOLTAGE ~ Always disconnect the power source before working on or near the control panel or lead wires.

HIGH VOLTAGE ~ Use insulated tools when making adjustments while the controls are under power.

NOTICE

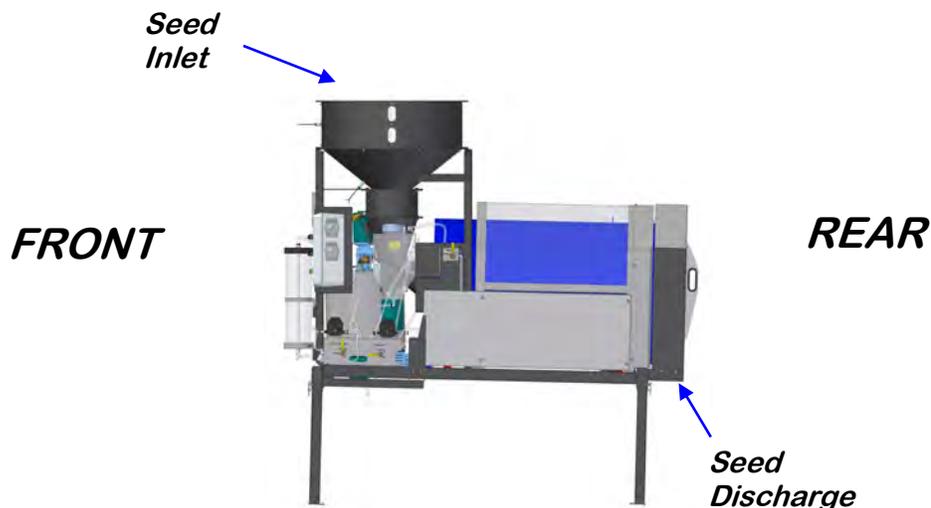

Permanent installation may require additional electrical cords, liquid hose, and air lines, since each installation is unique.

SET-UP

The following steps outline the initial set-up of your USC Seed Treating system:

1. Clear the area of bystanders, especially small children, before moving.
2. Be sure there is enough clearance from overhead obstructions and power lines or other equipment to move the machine into its working position.
3. Using a forklift, place the seed treater in the desired position on a level surface.

NOTICE USC highly recommends that the seed treater be set up inside a building or any covered structure to protect the machine from weathering.

4. Remove any boxes and the front leg from the drum of the treater.
5. Install the four legs provided and set up on a level surface, preferably concrete. When all four legs are mounted in the same pin hole, the seed treater has a slight slope to allow seed to travel through the machine. The pin holes are approximately 2" apart.

NOTICE If more slope is desired, the rear legs can be dropped an additional pin hole.

6. Anchor the seed treater in position to prevent the machine from moving during operation.
7. Inspect machine thoroughly for screws, bolts, fittings, etc. which may have come loose during shipping.
8. Remove the calibration tube from the box and install on the left side of the control panel using the pins. Once the calibration tube is set in place, connect the two chemical lines.
9. Remove the filter body from the control panel and install on the front of the treater. The filter is shipped in the control panel to avoid damage in shipping.
10. Check and tighten all hose connections.
11. Connect any conveyors into the seed treater control panel. Ensure that the conveyors being used are the same power ratings as the seed treater.

NOTICE The starters and overloads located in the seed treater panel are rated for 5 HP motors. Do NOT plug any conveyor into the seed treater that exceeds 5 HP.

NOTES

A large empty rectangular box with a black border, intended for handwritten notes.

SECTION
C

MECHANICAL OPERATION

SYSTEM OVERVIEW

SUPPLY HOPPER

The supply hopper has a capacity of approximately 7 units of seed. The hopper supplies seed to the atomizing chamber where seed first comes in contact with the treatment.

The seed flow is controlled by an adjustable seed gate. Refer to “Section E: Calibration, for instructions on adjusting the seed flow gate. Dry batch calibration runs will be required in order to determine the seed flow rate. Rates should be determined in Quantity/Time, this will allow for proper liquid / granular mixtures.

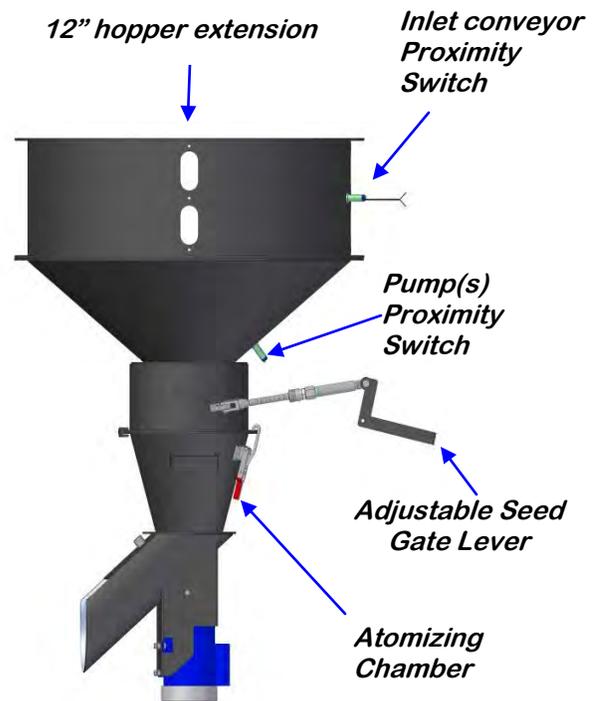

NOTICE Different seed types may be treated with this equipment. It is imperative to note that re-calibration of the seed gate setting will be required with each new seed type.

The hopper is equipped with two proximity switches. The top proximity switch controls the automatic start and stop of the inlet conveyor, so the supply hopper does not overflow. This proximity switch is not used on Tower Units. The lower proximity switch controls the automatic shut-off of the pump(s) when the hopper runs out of seed.. Refer to “Control Panel” in Section D, and Section F: Troubleshooting; “Proximity Switch Adjustment Guide” for more in-depth information on these proximity switches.

The distribution cone creates a curtain of seed which wraps around the atomizer head, ensuring that every seed is applied with treatment. (see page 37)

ATOMIZER CHAMBER

The Atomizer chamber consists of a patented design which disperses treatment evenly to each seed. A motor drives the atomizer head at approximately 1725 RPM's. As treatment is being pumped into the atomizer chamber, it drops into the atomizer head. The centrifugal force of the spinning head forces the treatment to be sprayed out through a screen covering in all 360 degrees. Meanwhile, seed flows down out of the supply hopper, down on top of the distribution cone which disperses the seed down around the atomizer head. (see page 37)

ROTATING DRUM

The rotating drum accepts treated seed through the opening on the hopper end. As seed passes through the length of the drum it is tumbled, producing accurate and uniform seed coating. The seed then exits the seed treater out the discharge end of the machine.

Never allow exposure of persons or clothing to the drive shaft, idler wheels, or the drum during operation. Always have the safety shields in place during operation.

PUMP #1 LIQUID SYSTEM

The USC seed treater is equipped with a 27-gallon mix tank with an electric drive liquid agitator to keep chemicals mixed and in suspension. The agitator should be running at all times when treatment is present in the mix tank. The tank is equipped with a shut-off, drain plug, and drain valve located on the bottom. The top of the tank also includes 3 extra ports which the operator can use to direct fill into the tank (see below).

Pump #1 liquid system is also equipped with a calibration tube, which is used to determine the liquid flow rate. The calibration tube measures in ounces on a 0-340 scale. Three-way valves direct liquid from different areas to keep all liquid contained.

Pump #1 Liquid System utilizes a variable speed peristaltic pump and special noprrene pump tubing for liquid metering. Liquid will only come into contact with the inside diameter of the pump tubing and not the pump. This allows for easy cleanup and less maintenance of the pump.

To open the pump head, turn lever to the left. Place pump tubing in pump head so it fits inside the notches and above the rollers. Turn lever back to the right to close the pump head, clamping the tubing inside the head. Wear or fatigue of the tubing due to usage and compression is normal. When tubing becomes worn or liquid rates begin to slow down, open the pump head and move the tubing to a different position. When the entire piece of tubing becomes worn, simply replace with a new section of tubing. When not using the machine for a few days or when storing, open the pump head and remove the tubing to prevent any unnecessary compression during the off-season.

Pump Head Open

Pump Head Closed

Pump #1 Valves Explained

Seed Treatment Source: This valve controls where pump #1 is drawing liquid from.

Pump #1 Drawing from bottom of Mix Tank

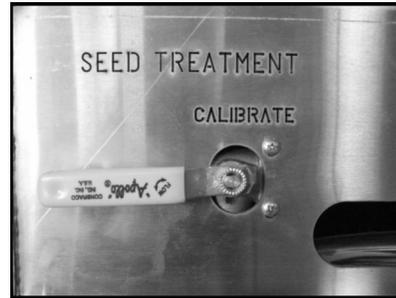

Pump #1 Drawing from bottom of Calibration Tube

Seed Treatment: This valve controls the direction of the liquid coming from pump #1.

Pump #1 pumping liquid to valve on top of mix tank.

Pump #1 pumping liquid to atomizer. Used when treating seed.

Valve on Mix Tank: This valve directs the liquid coming from the Calibrate side of the Seed Treatment Valve.

Pump #1 pumping liquid into the top of the mix tank when Seed Treatment Valve is in Calibrate.

Pump #1 pumping liquid into the top of the calibration tube when Seed Treatment Valve is in Calibrate.

Proper calibration of the liquid system is critical to achieve a proper granular/chemical mixture. Use the calibration procedure on page 30 to determine liquid flow rate.

Emptying the remaining liquid can be done by using the reverse function on the control panel. This will pump liquid back into the mix tank. Then drain the remaining liquid into a suitable container. Clean water should be pumped through the calibration tube and mix tank when finished.

Always dispose of chemical or diluted chemical according to your local, state, and federal regulations.

Only you, the operator, can determine the length of time required to completely rinse all chemical residue from the tank and plumbing system.

PUMP #2 LIQUID SYSTEM

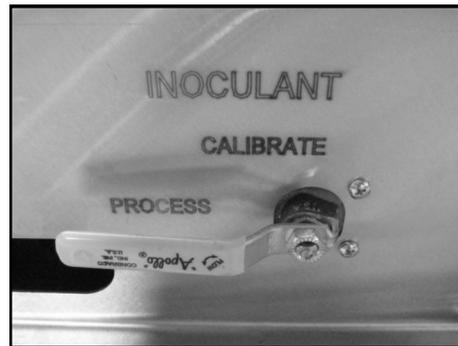

The Pump #2 Liquid System or Inoculant Kit includes an additional variable speed peristaltic pump, 2 three way valves, plumbing, and a 5 gallon poly tank. The pump is tied to the pump #2 controls which are pre-wired into the main control panel. (see page 30)

Pump #2 Valves Explained

Inoculant: This valve controls the direction of the liquid coming from the tank.

Pump #2 Pumping Liquid to Calibration Valve

Pump #2 Pumping Liquid to the Atomizer

Calibration Valve: This valve directs liquid which comes from the calibrate side of the Inoculant valve.

Directs liquid to the hose to the right of the valve to check calibration

Directs Liquid back into the top of the 5 gallon tank

**SECTION
D**

ELECTRICAL OPERATION

HIGH VOLTAGE ~ Always disconnect the power source before working on or near the control panel or lead wires.

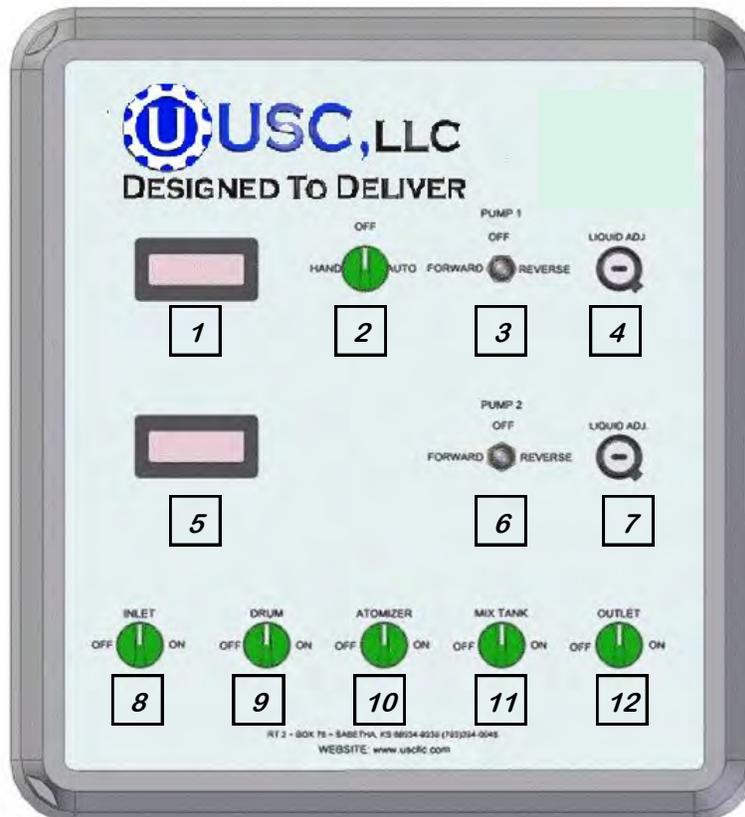

HIGH VOLTAGE ~ Use insulated tools when making adjustments while the controls are under power.

AUTHORIZED PERSONNEL only shall work on the control panel. Never allow anyone who has not read and familiarized themselves with the owner's manual to open or work on the control panel.

CONTROL PANEL

Refer to the control panel and the electrical schematic for proper voltage and amperage of the machine. All green switches will illuminate when activated. The bottom row of switches are spring return to center. The control panel controls the following functions:

Controls Explained

1. Pump #1 Voltmeter: Displays the DC voltage for pump #1. As pump #1 speed is increased or decreased, this number will also increase or decrease.

2. Hand/Off/Auto Switch (for Pump #1 & #2): This switch controls pump #1, pump #2, and any device connected to the auxiliary port. This switch must be activated before either pump will operate in forward or reverse.

- **Hand Position:** When the switch is placed in “Hand”, the pump(s) will run only when you have turned the pump(s) switch to forward or reverse, and the speed has been adjusted.

- **Auto Position:** When the switch is placed in “AUTO”, the pump(s) will only run when the lower proximity switch located in the supply hopper is covered and the atomizer is running. The proximity switch determines when seed is present in the hopper. When the proximity switch does not detect seed, a timer relay located inside the control panel will automatically shut off the pump(s) a pre-determined amount of time after the hopper has emptied. The timer relay (right) located in the control panel is set to Mode “D” and has an adjustable knob with settings from 0-6. Each number represents the number of seconds from the time the hopper empties until the pumps will shut off. The time delay allows all seed in the hopper to have an equal coverage.

3. Pump #1 Direction: This switch allows the operator to change the pump direction between forward and reverse. It has a safety feature that will not allow the operator to switch from forward to reverse or vice-versa without momentarily stopping and releasing the switch in the center position.

4. Liquid Adj. Pump #1: This dial allows the operator to adjust the speed of pump #1. The setting should be chosen in relation to the application rate for the treatment being applied to the seed.

5. Pump #2 Voltmeter: Displays the DC voltage for pump #2. As pump #2 speed is increased or decreased, this number will also increase or decrease.

6. Pump #2 Direction: This switch allows the operator to change the pump direction between forward and reverse. It has a safety feature that will not allow the operator to switch from forward to reverse or vice-versa without momentarily stopping and releasing the switch in the center position.

7. Liquid Adj. Pump #2: This dial allows the operator to adjust the speed of pump #2. The setting should be chosen in relation to the application rate for the treatment being applied to the seed.

8. Inlet Conveyor Switch: This switch controls the inlet conveyor in conjunction with a timer relay. When the switch is turned on, the conveyor will run until seed covers the proximity switch mounted near the top of the supply hopper, at which time the conveyor will turn off automatically. The inlet conveyor will remain off until seed has dropped below the proximity switch. A timer relay (right) will turn the conveyor back on after a pre-determined time. The timer relay located inside the control panel is set to Mode "A" and has an adjustable knob with settings from 0-6. Each number represents the number of seconds from the time the proximity switch is uncovered to when the conveyor will turn back on. The time delay prevents the conveyor from turning on and off too quickly.

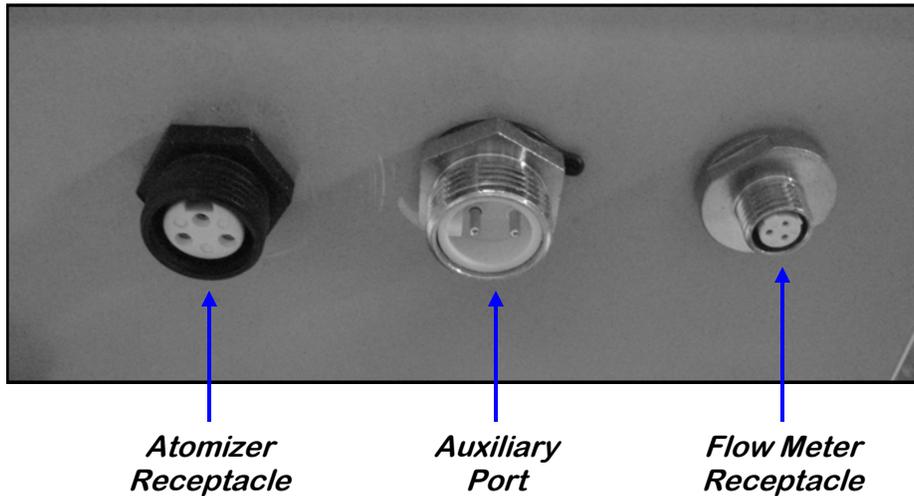

9. Drum: This switch allows the operator to turn the drum on or off.

10. Atomizer: This switch allows the operator to turn the rotary driven atomizer on or off for primary distribution of product on the seed. This switch must be turned on before the seed treating process begins and before the pump(s) will operate in "Auto".

11. Mix Tank: This switch allows the operator to turn the chemical mixer/agitator on or off to allow for a perfectly mixed application of the seed treatment.

12) Outlet Conveyor Switch: This switch allows the operator to turn the outlet conveyor on or off.

Bottom of Control Panel

Atomizer Receptacle: This receptacle is where the motor which runs the atomizer is plugged in to. The atomizer can be unplugged so it can be removed from the machine for maintenance.

Auxiliary Port: This port will allow an additional liquid system or dry additive feeder to tie in with the Automatic shut-off function. The Hand/Off/Auto switch will control the secondary system. This port does not supply power to a secondary unit.

Flow Meter Receptacle: If a flow meter is added to the machine, power is supplied to the meter through this receptacle. The receptacle is pre-wired into the control panel regardless if the machine is pre-ordered with a flow meter. This will allow for easy installation if a flow meter is added later.

SECTION
E**CALIBRATION**

Calibration of both the seed flow and liquid portions of the equipment is necessary for accurate treatment of seed.

NOTICE If you prefer metric measurements, please refer to the conversion chart on page 36.

SEED FLOW CALIBRATION

The following steps illustrate how to calibrate the seed flow for a LP series seed treater. A stop watch, ladder, and a know weigh of seed will be needed in the calibration process.

NOTICE If the seed treater is equipped with a Seed Wheel, refer to the Seed Wheel operator's manual for seed flow calibration instructions.

1. Position all equipment so that you are able to run a dry batch of seed through the seed treater and catch it back into a container. This will allow you to easily run the seed through again to recalibrate or begin treating.
2. Set the adjustable seed gate lever at a position that you and your equipment can handle. (all the way open – approximately 950 bushels/hr. or 430 kg/min) Refer to page 29 for adjusting the seed gate. Calibrations should be done with at least 40 units or 2000 lbs.
3. Place the Drum and any conveyors to the “ON” position.
4. When equipment is in position, begin running seed through the seed treater. Using the stop watch, begin timing as soon as the seed lands in the bottom of the supply hopper.

NOTICE Be sure the supply hopper stays full at all times. If seed does not pile-up in the hopper, the seed calibration will not be accurate.

5. Stop timing after all seed has left the supply hopper.
6. Calculate the seed flow rate: Total Pounds per Minute.

EXAMPLE: 2000 pounds takes 3 minutes and 7 seconds, or 187 seconds
 $2000 \text{ pounds} / 187 \text{ seconds} = 10.69 \text{ pounds/seconds}$
 $10.69 \times 60 \text{ seconds} = 641 \text{ lbs/minute}$
 $641 / 100 = 6.41 \text{ cwt/min (hundred weight per minute)}$

NOTICE Different seed sizes and different seed types will tend to flow differently. Be sure to check calibration when changing to a different seed size or seed type.

ADJUSTING THE SEED FLOW GATE

Below are pictures that illustrate how to open, close, and adjust the opening of the seed flow gate.

When the black lever is pulled down, the seed gate is in the closed position, and will not allow seed to flow through

When the black lever is pushed up, the seed gate is in the open position, and seed will flow through

Regulate the amount of seed flowing through the seed treater by using the spring-loaded coupler and moving it to a different notch. The more notches exposed, the higher the seed flow.

PUMP #1 CALIBRATION

The following steps illustrate how to calibrate pump #1 on an LP series seed treater. A stop watch will be needed in the calibration process.

NOTICE If the seed treater is equipped with a flow meter, refer to the Flow Meter operator's manual for pump calibration instructions.

1. Lock down the pump tubing in the Pump #1 pump head. (page 21)
2. Premix enough liquid for the amount of seed you will be treating and pour into the 27 gallon stainless steel tank. It's always a good practice to mix up 20% extra slurry to help fill all the lines. Turn on the mix tank and allow liquid to mix.
3. Turn the "SEED TREATMENT SOURCE" valve to the "MIX TANK" position, the "SEED TREATMENT" valve to the "CALIBRATE" position, and the valve on top of the mix tank to "MIX TANK".
4. Turn the pump #1 direction switch to "FORWARD".
5. Turn the "Hand/Off/Auto" switch to the "Hand" position and set the Pump #1 liquid adjust dial (right) to about "500" or half speed. The liquid should begin re-circulating from the bottom of the mix tank, through the pump, and back into the top of the mix tank.
6. Allow pump to re-circulate liquid for approximately 15 minutes to ensure all air has been removed from the liquid lines. This will also help "break-in" the pump tubing, which is critical before checking pump calibration.
7. After you have allowed the liquid to re-circulate you are ready to calibrate the pump. Determine the number of ounces needed in one minute.

EXAMPLE: The seed treatment slurry rate is 4 ounces per cwt.
 $\text{Seed Flow Rate} = 6.41 \text{ cwt/min.} \times 4 \text{ oz./cwt.} = 25.6 \text{ oz./min.}$
 25.6 oz. is the rate the pump should be pumping in one minute.

8. Set the Liquid Adjustment Dial . You can use the chart on page 34 to find a starting point.

EXAMPLE: The ounces needed in one minute = 25.6 oz/min. Assume we are using a 6-600 Masterflex pump. An approximate starting point is dial setting 320 on the liquid adjustment dial.

9. Using the stop watch, determine the pump flow rate. Keeping the pump running, position the valve on top of mix tank to “CALIBRATION TUBE”. When liquid reaches 0 (zero) or an even number, begin timing for one minute. (see Figure 1, below)
10. As soon as one minute is up, position valve on top of mix tank to “MIX TANK”. Read the level on the side of the calibration tube (see Figure 2, below). This number should equal the number of ounces needed to flow through the pump in one minute. If the ounces needed per minute have not been met, re-adjust the pump speed up or down accordingly and repeat steps 9 & 10 until the liquid flow rate has been matched.

Figure 1
Liquid at 0 oz.

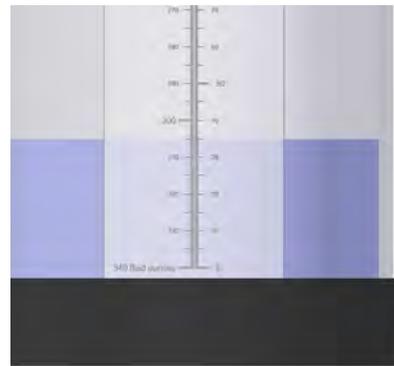

Figure 2
Liquid at 35 oz.
after 1 minute

PUMP #2 CALIBRATION

The following steps illustrate how to calibrate pump #2 on an LP series seed treater. A stop watch and measuring cup will be needed in the calibration process.

1. Lock down the pump tubing in the Pump #2 pump head. (page 21)
2. Premix enough liquid for the amount of seed you are treating and pour into the 5 gallon poly tank. It's always a good practice to mix up 20% extra slurry to help fill all the lines.
3. Turn the "INOCULANT" valve to the "CALIBRATE" position, and position the Calibration Valve to "RECIRCULATE".
4. Turn the pump #2 direction switch to "FORWARD".
5. Turn the "Hand/Off/Auto" switch to the "Hand" position and set the Pump #2 liquid adjustment dial (right) to about "500" or half speed. Liquid should begin circulating from the bottom of the mix tank, through the pump, and back into the top of the tank.
6. Allow pump to re-circulate liquid for approximately 15 minutes to ensure all air has been removed from the liquid lines. This will also help "break-in" the pump tubing, which is critical before checking pump calibration.
7. After you have allowed the liquid to circulate you are ready to calibrate the liquid flow. Determine the number of ounces needed in one minute.

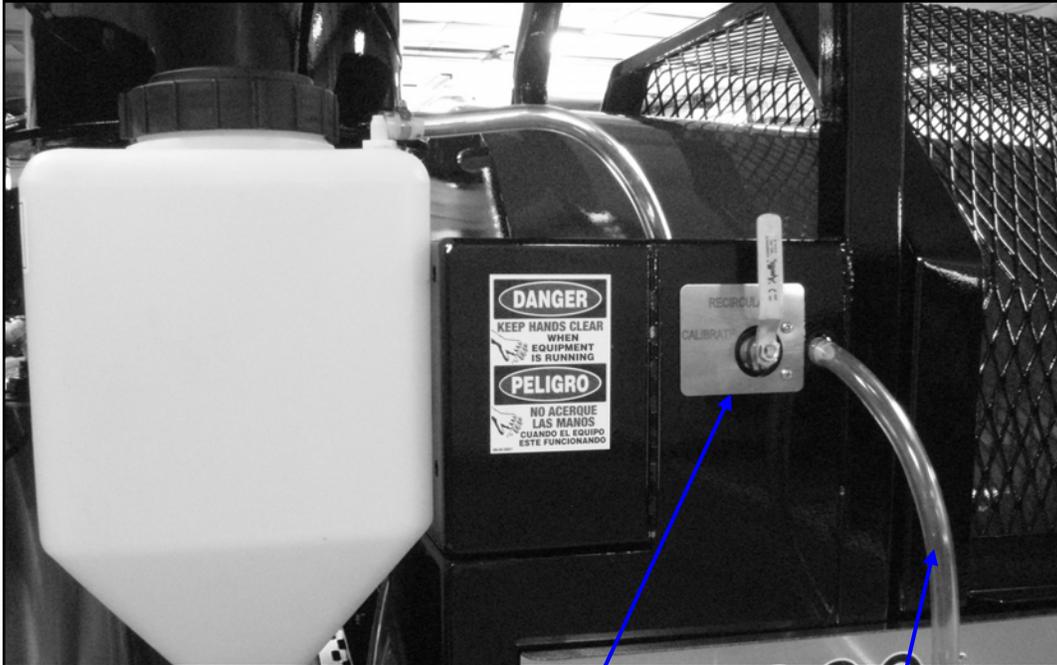

EXAMPLE: The seed treatment slurry rate is 5 ounces per cwt.
 Seed Flow Rate = 6.41 cwt/min. x 5 oz./cwt. = 32.1 oz./min.
 32.1 oz. is the rate the pump should be pumping in one minute.

8. Set the Liquid Adjustment Dial . You can use the chart on page 34 to find a starting point.

EXAMPLE: The ounces needed in one minute = 32.1 oz/min. Assume we are using a 6-600 Masterflex pump. A good starting point is approximately dial setting 400 on the liquid adjustment dial.

9. Using the stop watch and measuring cup, determine the pump flow rate. Hold the measuring cup under the calibration hose next to the Side Valve.
10. Keeping the pump running, position the Calibration Valve to "CALIBRATE". When liquid begin timing for one minute as soon as liquid begins flowing into the measuring cup.

11. As soon as one minute is up, position the Calibration Valve back to “RECIRCULATE”. Read the level on the side of the measuring cup. This number should equal the number of ounces needed to flow through the pump in one minute. If the ounces needed per minute have not been met, adjust the pump speed up or down accordingly and repeat steps 9,10, & 11 until the liquid flow rate has been matched.

Calibration Valve

Calibration Hose

Standard Data

Below are two charts that show the potential volts and oz./min of two different pumps at different dial settings.

NOTICE *All calibrations were done using water. Numbers are not exact; only use these numbers as a starting point or for troubleshooting.*

75.5	7,155
79.6	7,561
83.8	7,966
87.9	8,372

TREATING SEED

1. Prime the line going to the atomizer by turning the Atomizer switch to “ON” and turn the “SEED TREATMENT” valve to “PROCESS”. Next turn the pump direction switch to “FORWARD” and the “Hand/Off/Auto” switch to “Hand”. Liquid should begin pumping up to the atomizer. After the line has been primed, turn the “Hand/Off/Auto” switch to “Auto”. Additional liquid can be pumped up into the atomizer and into the drum to guarantee coverage of the first seed that passes through the machine.

Do **NOT** pump liquid into the atomizing chamber when the atomizer is “OFF”.

2. Position the “SEED TREATMENT SOURCE” valve to “MIX TANK”.

NOTICE

If you desire to check the total ounces used per batch of seed. Fill the calibration tube with the amount needed for the batch of seed (approximately 10 ounces extra to be safe). Then position the “SEED TREATMENT SOURCE” valve to “CALIBRATION TUBE”.

3. Position conveyors, overhead hopper, or seed box so the first seed coming into the seed treater lands on the lower proximity switch which automatically turns on the pump(s).
4. Turn the switches to “ON” for the Drum, Atomizer, and any Conveyors being used. With all motors turned to the “ON” position, you are ready for seed.
5. Begin sending seed into the seed treater. As soon as seed lands on the proximity switch, the pump will turn on and the seed treating process will begin.

NOTICE

If the first seed is not well coated, the “Hand/Off/Auto” switch can initially be turned to “Hand” before the seed comes into the treater. Once the supply hopper is full, the switch can be turned to “Auto”.

6. When all seed has passed through the atomizer, the pump will automatically shut off.

Conversion Chart

1 ounce = 29.58 milliliters

1 gallon = 3.79 Liters

1 kilogram = 2.2 pounds

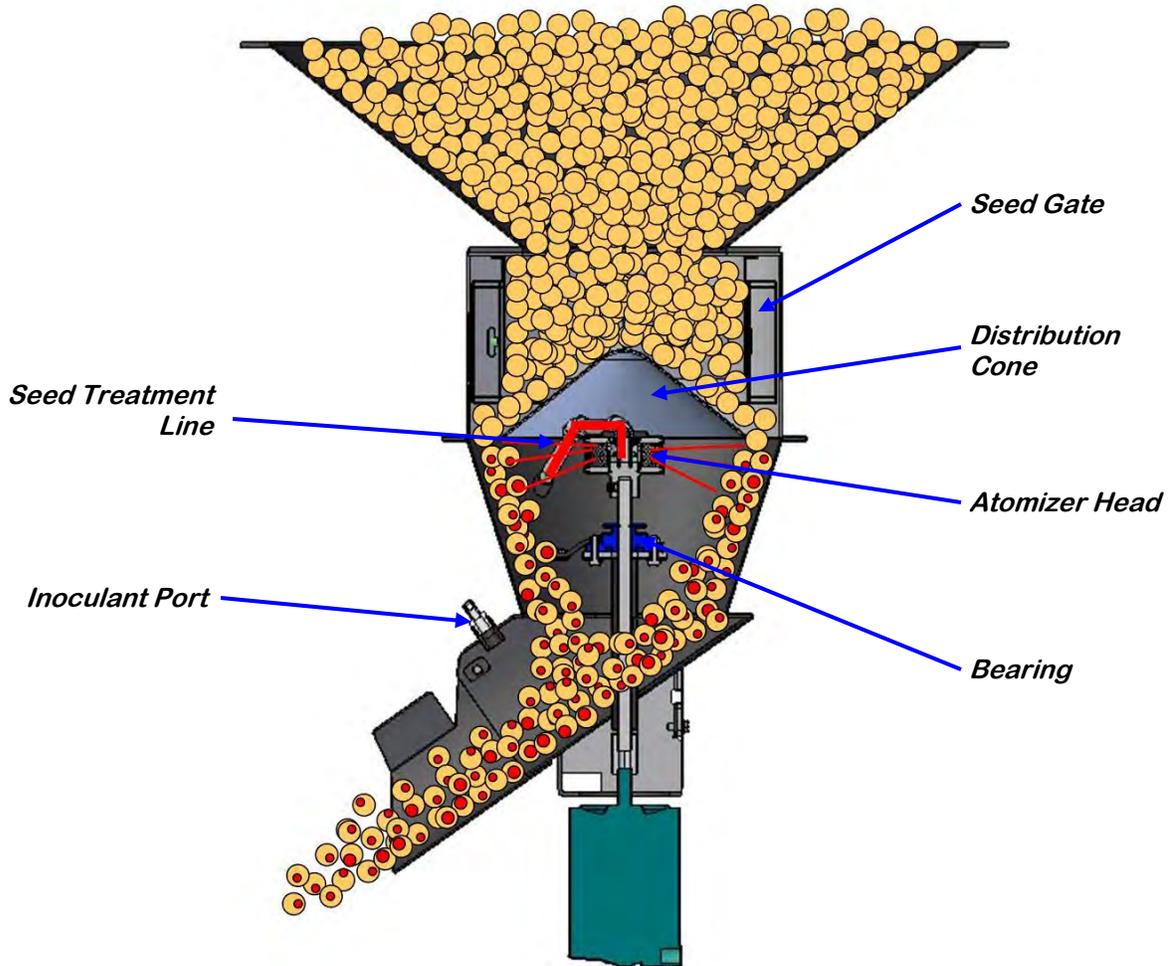

1 unit = 50 lbs or 22.73 kg

1 bushel = approx. 60 lbs or 27.27 kg

1 cwt = 100 lbs or 45.45 kg

LP800

The illustration below shows how seed passes through the atomizing chamber. The red represents treatment being dispensed to the seed as it passes through the chamber. After the seed passes through the atomizer, it goes into the drum where the coating process is completed.

**SECTION
F**

TROUBLESHOOTING

Below is a table describing the most frequent problems and solutions with the USC Seed Treater. For further assistance, contact your local USC dealer.

Problem	Possible Cause	Solution
Inlet Conveyor will not turn on.	<ol style="list-style-type: none"> 1. Inlet Conveyor Proximity Switch is activated. 2. Inlet Conveyor Proximity Switch is too sensitive. 3. Overload is tripped 4. Conveyor is plugged into wrong outlet on seed treater panel. 	<ol style="list-style-type: none"> 1. Clean Proximity Switch 2. Adjust the inlet conveyor Proximity Switch sensitivity by turning the adjustment screw counter-clockwise (page 40) 3. Hit reset button on Inlet Conveyor Overload. 4. Check to make sure the inlet conveyor is plugged into the inlet conveyor receptacle.
Pump will not turn off in "AUTO" when seed runs out.	<ol style="list-style-type: none"> 1. Proximity Switch is dirty 2. Proximity Switch is set too sensitive. 	<ol style="list-style-type: none"> 1. Clean Proximity Switch 2. Adjust the pump Proximity Switch sensitivity by turning adjustment screw counter-clockwise (page 40).
Pump will not turn on in "AUTO"	<ol style="list-style-type: none"> 1. Proximity Switch is not staying covered 2. Atomizer is not on 3. Proximity Switch is not sensitive enough 	<ol style="list-style-type: none"> 1. Make sure Proximity Switch is staying covered with seed 2. Turn on Atomizer. Atomizer must be on to run pump #1 <u>and</u> #2 in Auto. 3. Adjust pump Proximity Switch sensitivity by turning the adjustment screw clockwise (page 40).
Inlet conveyor won't shut off when hopper is full.	<ol style="list-style-type: none"> 1. Seed is not hitting proximity switch. 2. Proximity Switch is not set sensitive enough. 3. Inlet Conveyor is plugged into wrong receptacle. 	<ol style="list-style-type: none"> 1. Make sure seed is hitting Proximity switch. 2. Adjust the inlet conveyor Proximity Switch by turning the adjustment screw clockwise (page 40). 3. Make sure Inlet Conveyor is plugged inlet conveyor receptacle.

Problem	Possible Cause	Solution
Pump is Fluctuating	<ol style="list-style-type: none"> 1. Restriction in tubing 2. Tubing was not broken-in properly before calibrating. 3. DC Pump circuit board is going bad. 	<ol style="list-style-type: none"> 1. Flush tubing and check filter for any restrictions. 2. Allow pump to recirculate for 15 minutes before checking calibration. 3. Watch pump voltmeter for any fluctuations. The pump board may have to be replaced.
Pump will not turn on.	<ol style="list-style-type: none"> 1. Blown Fuse 2. Bad HP Resistor 3. Bad DC Pump Board 	<ol style="list-style-type: none"> 1. Check fuses 2. Check HP Resistor 3. Change the DC Pump Board Part #: (03-01-0007)
Seed Calibration is fluctuating	<ol style="list-style-type: none"> 1. Seed Treater surge hopper is not staying full. 2. Restriction in the surge hopper. 3. Build-up in the atomizing chamber. 	<ol style="list-style-type: none"> 1. Make sure the surge hopper is staying full. May have to close down seed gate in order to have a consistent flow of seed. 2. Check surge hopper for any debris, and remove. 3. Remove atomizing housing and clean out any build-up of material.
Drum is slipping and seed is coming out the inlet side of the drum.	<ol style="list-style-type: none"> 1. Drum is wet 2. The seed treater is set too level 3. Chains are too loose 	<ol style="list-style-type: none"> 1. Dry off any moisture that may have collected on the outside of the drum. 2. Adjust the slope of the seed treater to at least a 3" drop from front to back. If desired, more slope can be applied. 3. Check and tighten the drive chains. Also check the chain alignment.
Certain motors will not turn on.	<ol style="list-style-type: none"> 1. Overload is tripped 2. Incoming power is incorrect or has been disconnected. 3. Cord has been cut or is disconnected. 	<ol style="list-style-type: none"> 1. Hit reset button on Overload inside control panel 2. Test incoming power. 3. Check cord to motor.

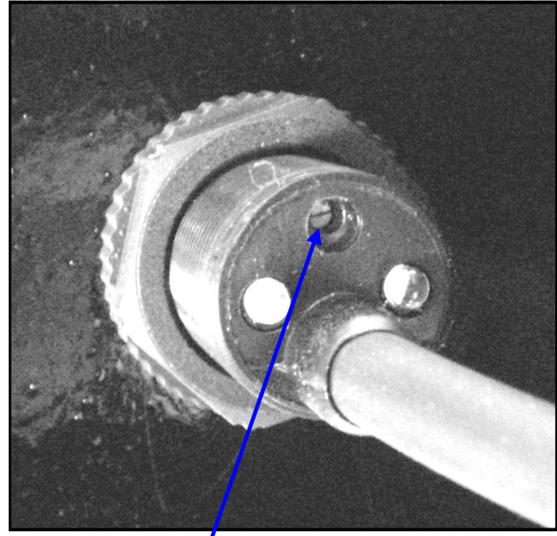

PROXIMITY SWITCH ADJUSTMENT GUIDE

The proximity switches mounted in the extension ring and cone of the seed treater detect when seed is present.

The proximity switch located in the extension ring is used to automatically shut off the inlet conveyor when the surge hopper is full. This proximity switch is not present on Tower systems.

The proximity switch mounted in the cone automatically shuts off the pump when all seed has left the hopper.

Sometimes these proximity switches do not properly work. This can be caused from wear, dust, or even moisture. The first step is to clean the lens of the proximity switch. If this does not solve the problem, the next step would be to adjust the sensitivity of the proximity switch.

Sensitivity Adjustment Screw

Proximity Switch Screwdriver

Using the small screwdriver provided inside the control panel, you can adjust the proximity switch by turning the adjusting screw on the back of the proximity switch.

- Turn Clockwise to make the proximity switch more sensitive.
- Turn Counterclockwise to make the proximity switch less sensitive.

MAINTENANCE

SECTION G

Proper maintenance of the USC seed treater is critical for peak performance, reliability and accuracy of this system. The following is a guideline for the type of maintenance and servicing that should be performed on this unit. Your environment and uses may require additional maintenance and service beyond this list to assure a reliable and safe unit. The operator of this unit has ultimate responsibility to identify areas of concern and rectify them before they become a hazard or safety issue. There is no substitute for a trained, alert operator.

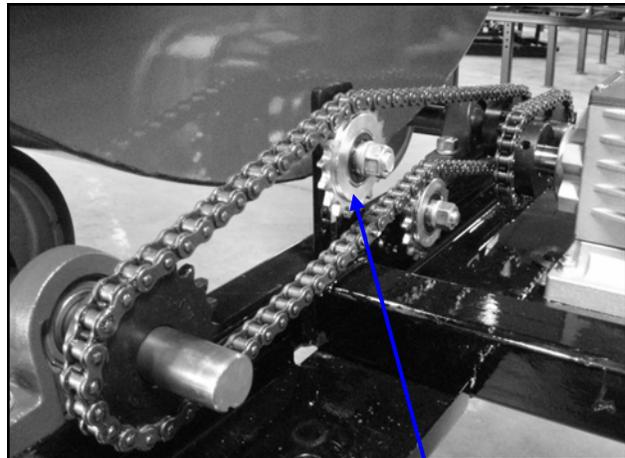

Do not put this unit into operation with any questionably maintained parts. Poor performance or a hazard may occur.

DRIVE AND DRUM

- Inspect all welds and structural components on frame
- Check drum for bends, cracks and damage.
- Remove shields to inspect bearings and tighten set screws.
- Inspect drive wheels for unordinary wear, and set screws for tightness.
- Inspect and adjust the Neoprene guide wheels located near back of drum.
- Tighten and lubricate chains.
- Inspect and re-align sprockets.

*Remove these 2
guards to access
chains*

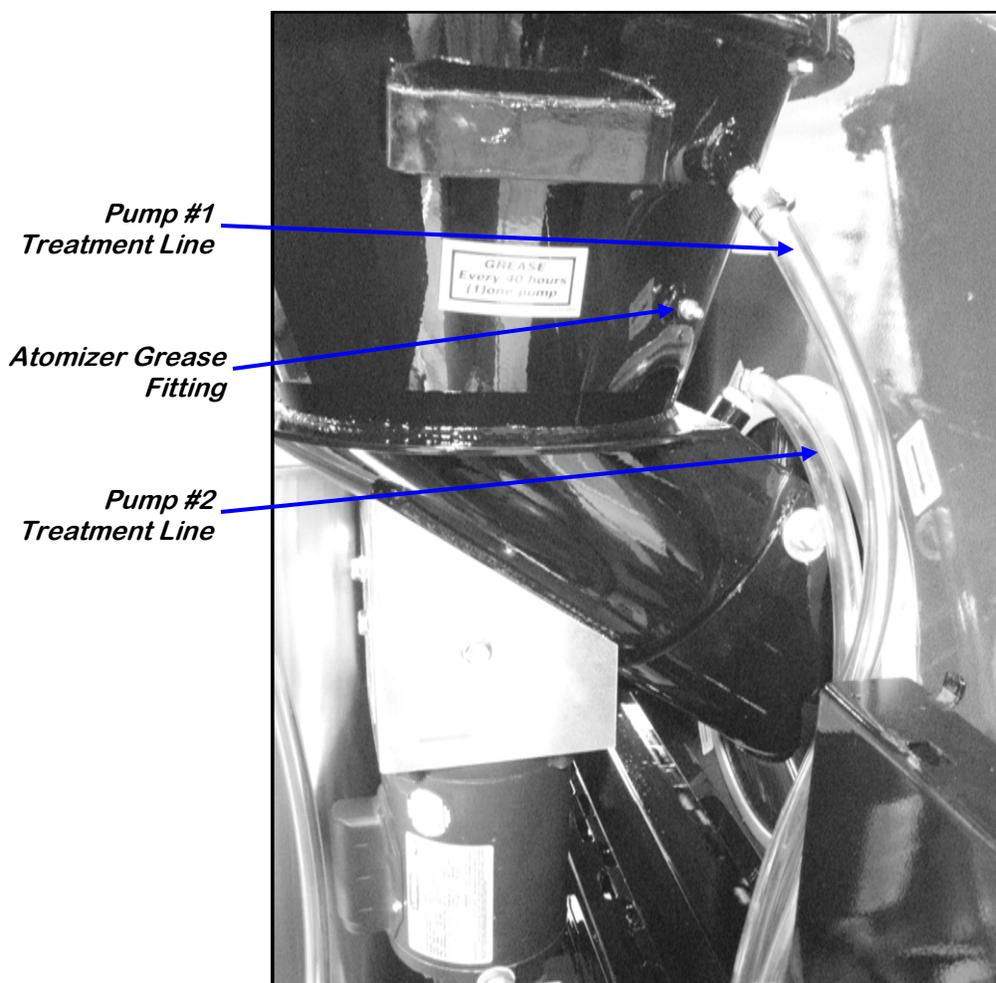

*Use this sprocket to
tighten chain*

PUMPS AND PLUMBING

- Check pump in forward and reverse.
- Check and adjust pump voltage
- Inspect brushes in motors.
- Make sure pump head opens and closes smoothly.
- Inspect tubing and valves.
- Tighten hose clamps and check filter.

ATOMIZER

- Remove atomizer from treater, grease bearing (40 hrs), and clean any build-up.
- Check for any play in the atomizer shaft.
- Make sure the atomizer spins smoothly.

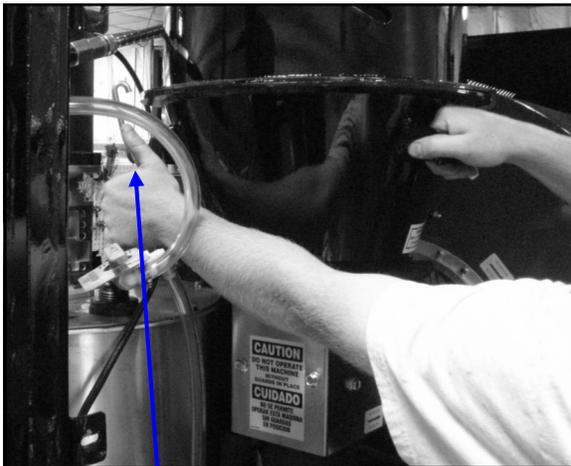

Removing Atomizer Housing

Below are instructions and pictures that illustrate how the atomizer is removed and where the bearing is located.

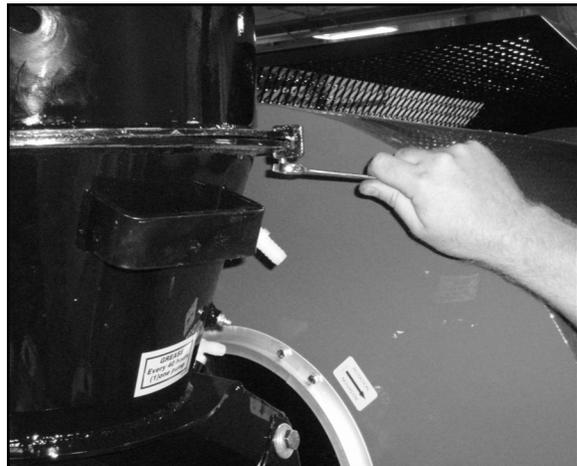

1. Remove the two bolts that secure the control panel in place, and swing out the control panel. The inoculant tank can also be swung open at this time.

2. Release the red-handled clamp and remove the small shipping bolt. Also loosen the two 5/16" bolts, located towards the front of the atomizer. This holds the top atomizer flange tight against the adjustable seed gate flange (below right).

Red-Handled Clamp

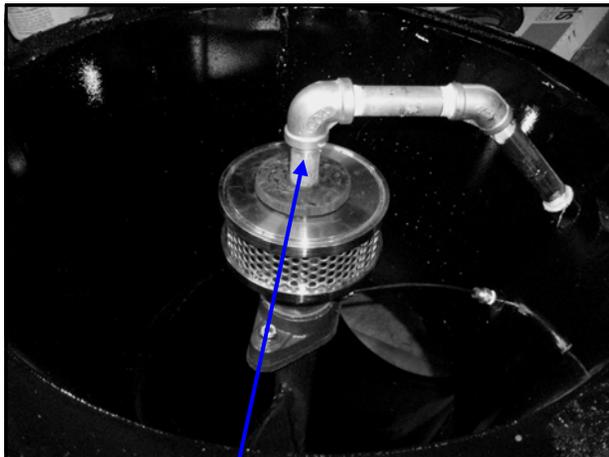

3. Slide the atomizer straight back and drop down to access the atomizer head and bearing (below). To completely remove the housing from the treater, unplug the motor from the control panel and disconnect the treatment lines.

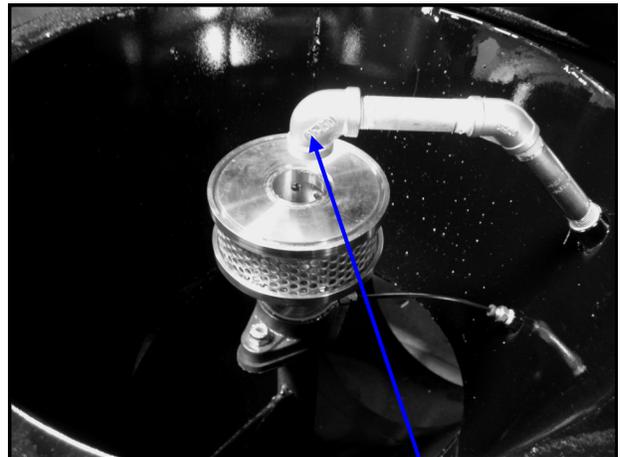

Removing Atomizer Head

Below are instructions and pictures that illustrate how the atomizer head is removed and where the bearing is located.

1. Remove the small nipple that leads down into the atomizer head. The nipple is threaded only into the 90 degree elbow fitting.

Small nipple

90 degree elbow

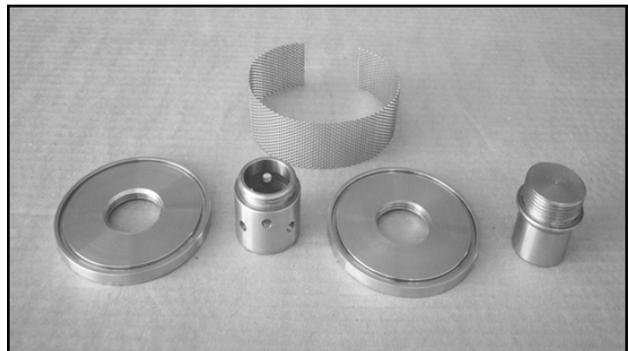

2. Remove the rest of the plumbing in one piece. A wrench may be used to loosen the plumbing.

3. Use a 3/16" allen wrench and loosen the set screw located on the bottom of the atomizer head. Next remove the head from the shaft.

4. The atomizer head is threaded together. Unscrew the head for better access to cleaning.

MIX TANK

- Check motor.
 - Check for any play in the mix tank shaft.
 - Check valves, fittings, and plug on bottom of tank.
-

CONTROL PANEL

- Check and tighten wire connections.
- Check starters and overloads.
- Check timers and relays.
- Check the front of the panel; switches, voltmeter, potentiometer, etc.
- Inspect fuses and breakers.
- Check and set the proximity switches.

When storing the USC seed treater for long periods of time, the following procedure must be followed to reduce the chance of rust, corrosion and fatigue of the treater. You can also use these steps when storing the machine for the winter.

A dust mask and protective rubber gloves shall be used when cleaning the machine.

SUPPLY HOPPER

1. Clean out the supply hopper of any debris (compressed air can be used).
2. Wipe the proximity switches clean.
3. Tarp or cover the hopper to keep out any unwanted pests.

ATOMIZER CHAMBER

1. Remove and clean the atomizer housing (see instructions on page 43).
2. Remove the atomizer head and stainless steel plumbing. The atomizer head can be disassembled (below), for easier cleaning. It is threaded together and can simply be unscrewed.
3. Reinstall the atomizer head and plumbing. Grease the bearing and spin the atomizer head a few times to ensure all grease has been worked into the bearings.

ROTATING DRUM

1. Remove the shields and clean out any seed that may have fallen underneath the drum.
 2. Lubricate the chain to keep from corroding in storage.
-

LIQUID SYSTEM

1. Make certain the inside of the tank is completely drained of chemical residue and thoroughly flush the inside of the tank with clean water.
2. Remove and clean the filter.
3. Pump clean water through all areas of the plumbing including the mix tank, calibration tube, and valves.
4. Open all drain points, valves, and filter to let as much of the liquid drain as possible.
5. If the seed treater will be exposed to possible freezing temperatures, the final flush of the system should be made with a non-freezable liquid. Or use compressed air to blow the lines out from any moisture.
6. Release pump head (right) and remove tubing to prevent any unnecessary wear.

FINAL

1. Store the machine inside a protective building to keep it from being exposed to the weather.
2. Disconnect power to the machine.

MECHANICAL DRAWINGS

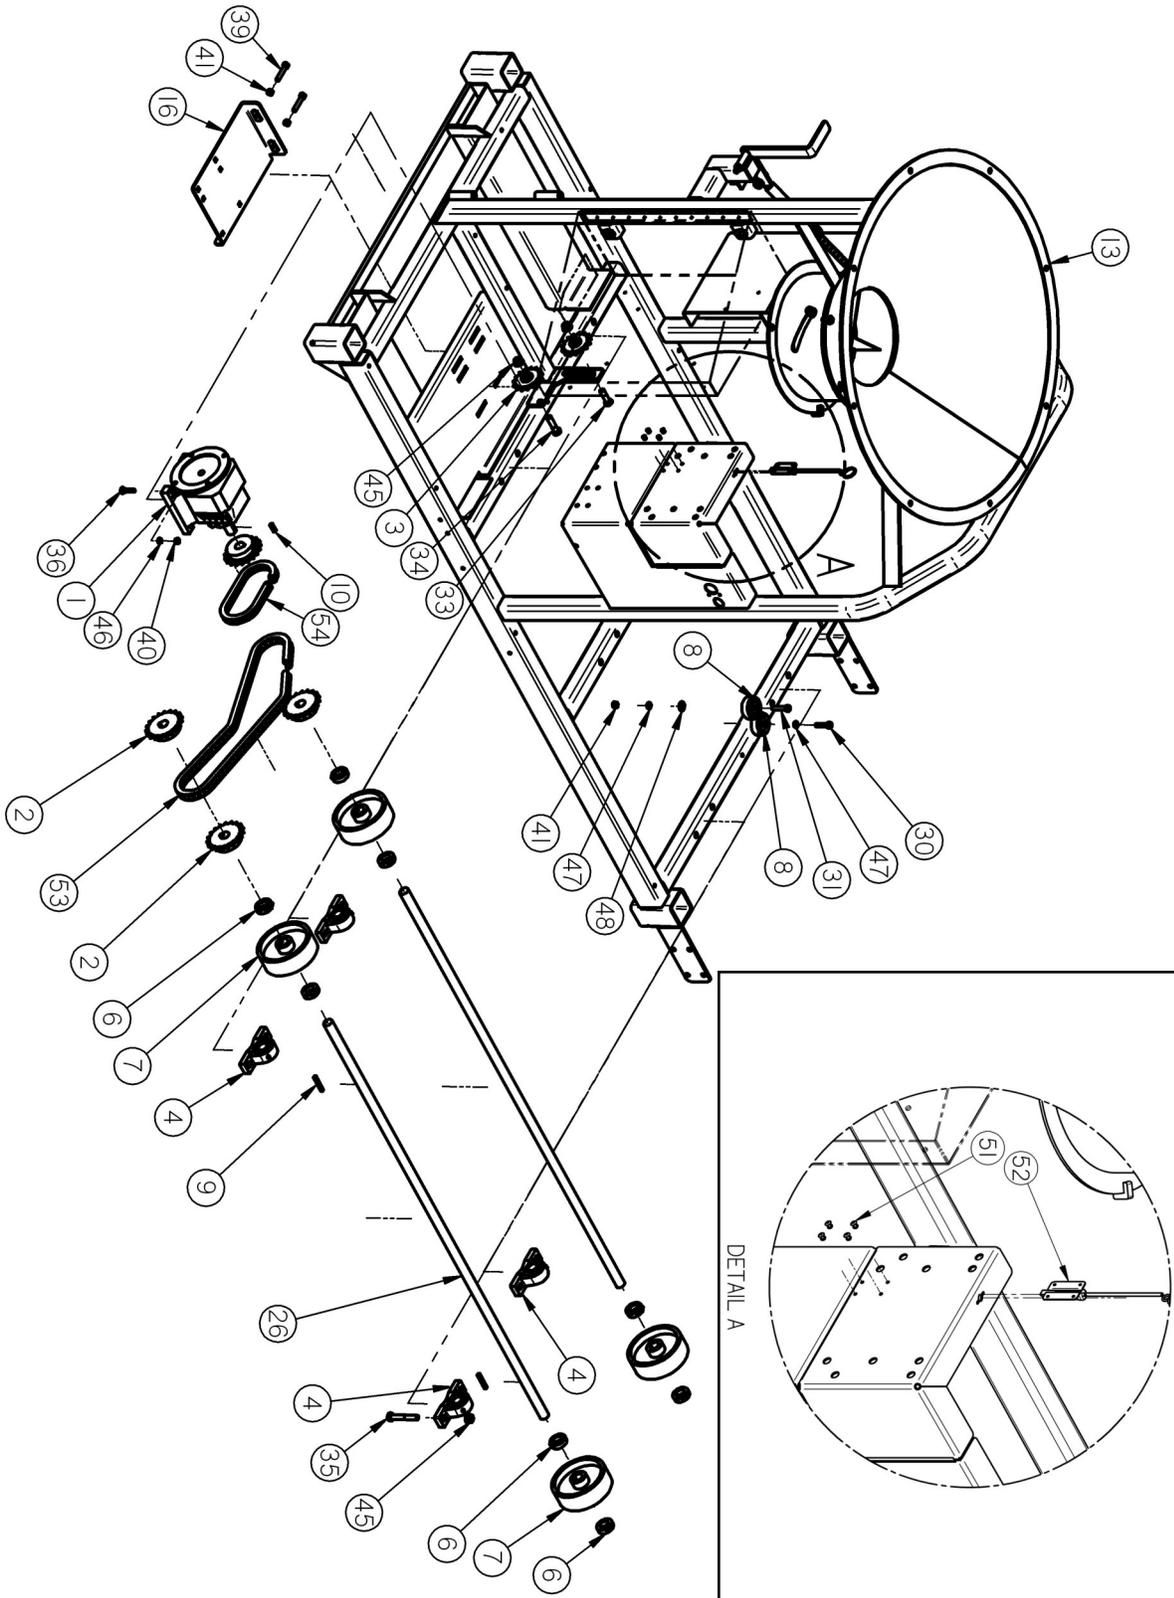

SECTION I

The following pages show the parts of your seed treater. Please have the part number ready when ordering parts.

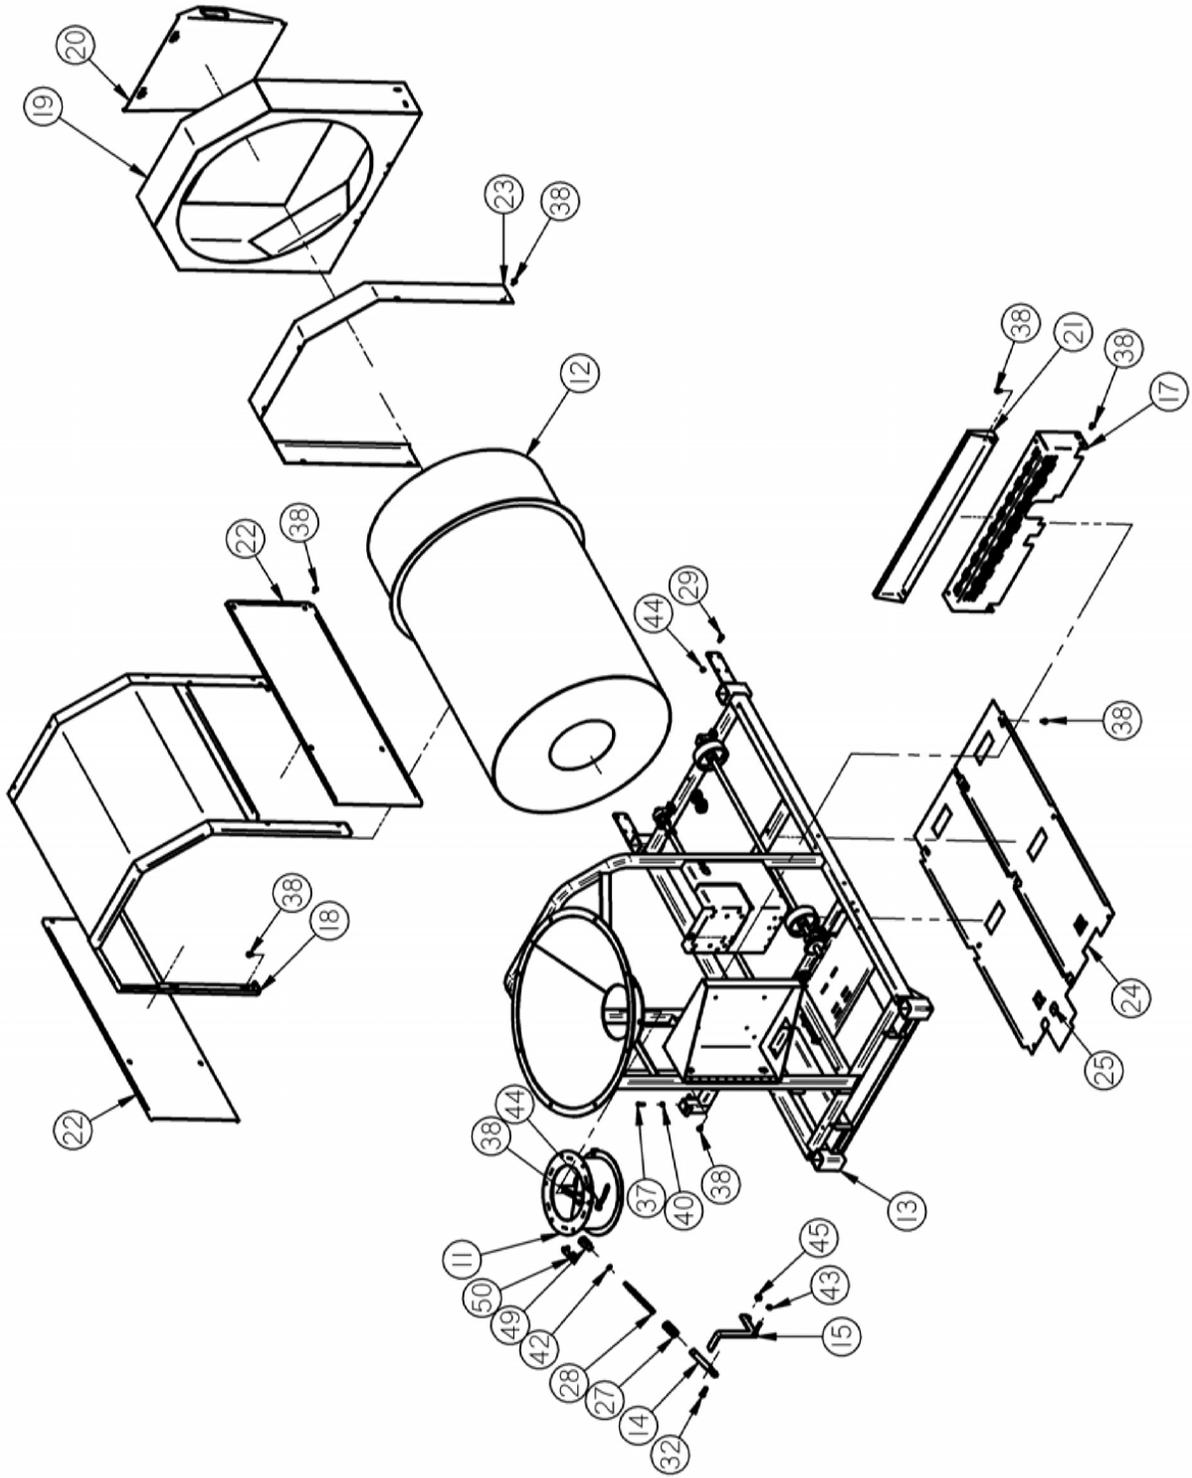

NOTICE SOME PARTS FOR COTTON/RICE TREATERS ARE DIFFERENT. IF YOU HAVE A COTTON/RICE SEED TREATER, LOOK FOR THE COTTON SYMBOL IN THE PARTS LIST BEFORE ORDERING.

Electric Control Panel Parts List

An electrical wiring diagram is located in the control panel of the seed treater at the time of shipment. The diagram located in the panel shows the exact electrical schematic for that model of seed treater. If you have any questions about the diagram, please call your local USC dealer.

Item #	Part #	Part Description	Qty
1	03-01-0008	DC VOLTMETER	2
2	03-10-0008	3-POSITION PANEL SWITCH, MAINTAIN	1
3	03-10-0001	FORWARD-BRAKE-REVERSE SWITCH	2
4	07-01-0001	COUNTING DIAL	2
5	03-10-0055	3-POSITION PANEL SWITCH, SPRING RETURN TO CENTER	4 to 5

SECTION
J**LIMITED WARRANTY**

USC, LLC, (Manufacturer) warrants its seed treating equipment as follows:

1. **Limited Warranty:** Manufacturer warrants that the Products sold hereunder will be free from defects in material and workmanship for a period of 12 months from date of shipment. If the Products do not conform to this Limited Warranty during the warranty period, Buyer shall notify Manufacturer in writing of the claimed defects and demonstrate to Manufacturer satisfaction that said defects are covered by this Limited Warranty. If the defects are properly reported to Manufacturer within the warranty period, and the defects are of such type and nature as to be covered by this warranty, Manufacturer shall, at its expense, furnish replacement Products or, at Manufacturer's option, replacement parts for the defective products. Shipping and installation of the replacement Products or replacement parts shall be at the Buyer's expense.

2. **Other Limits:** THE FOREGOING IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Manufacturer does not warrant against damages or defects arising from improper installation (where installation is by persons other than Manufacturer), against defects in products or components not manufactured by Manufacturer, or against damages resulting from such non-Manufacturer made products or components. Manufacturer passes on to the Buyer the warranty it received (if any) from the maker of such non-Manufacturer made products or components. This warranty also does not apply to Products upon which repairs and/or modifications have been effected or attempted by persons other than pursuant to written authorization by Manufacturer. Manufacturer does not warrant against casualties or damages resulting from misuse and/or abuse of product(s), acts of nature, effects of weather, including effects of weather due to outside storage, accidents, or damages incurred during transportation by common carrier.

3. **Exclusive Obligation:** THIS WARRANTY IS EXCLUSIVE. The sole and exclusive obligation of Manufacturer shall be to repair or replace the defective Products in the manner and for the period provided above. Manufacturer shall not have any other obligation with respect to the Products or any part thereof, whether based on contract, tort, strict liability or otherwise. Under no circumstances, whether based on this Limited Warranty or otherwise, shall Manufacturer be liable for incidental, special, or consequential damages.

4. **Other Statements:** Manufacturer's employees or representatives' oral or other written statements do not constitute warranties, shall not be relied upon by Buyer, and are not a part of the contract for sale or this limited warranty.

5. **Return Policy:** Approval is required prior to returning goods to USC, LLC. A restocking fee will apply.

6. **Entire Obligation:** This Limited Warranty states the entire obligation of Manufacturer with respect to the Products. If any part of this Limited Warranty is determined to be void or illegal, the remainder shall remain in full force and effect.
